PRECAST BULLETIN

ARMCON

CERTAINTY IN CONCRETE

Correct Vibration Speed

To get the best concrete results your mould should sit on the vibrating table without bouncing. This ensures all the air is removed quickly and effectively.

Aggressive vibration can lead to segregation and also cause spillage of concrete out of the mould.

Correct vibration ensures the concrete is fully compacted and excess air is removed quickly and effectively.

TECH TIP

Correct compacting/vibrating improves the finish of your product.
